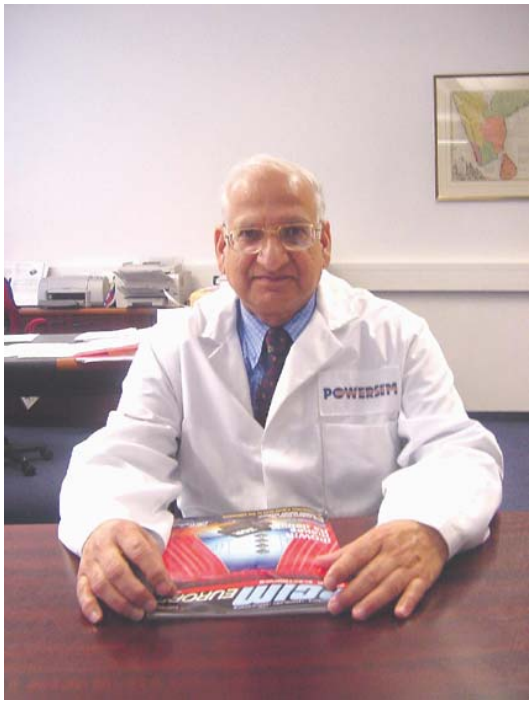
In Memoriam to
Madan Mohan Chadda

Founder of POWERSEM
a motor in progress of power electronics

*"**Madan** had realized his dreams building up a company in power electronics and finding the families home in Schwabach in Frankonia. His spirit and dreams are on continuity by his son Ashok."*



Mr. Madan Mohan Chadda (1939-2002) was born in Amritsar, India. He was a renowned physicist and scientist - B. Sc. (Hons.); M. Sc. (Math.); M. Sc. (Phys.) -, educated in India and England, and worked for many established corporations in India, England, Switzerland and Germany until he settled down with his family in Germany. For his work as a physicist, **Mr. Chadda** obtained over 40 patents in his lifetime.

Mr. Chadda founded **POWERSEM GmbH** in Germany in 1985. The pinnacle of his remarkable career was the opening of a brand new, state-of-the art facility in 2000 utilizing clean and efficient hydrogen power. **POWERSEM** designs, develops and manufactures multiple chip semiconductor modules. Today, **POWERSEM** is considered a world leader in designing and manufacturing isolated base packaged modules for standard, fast single, three phase, half and full controlled power semiconductor modules in a compact package. **POWERSEM** has offices and representation throughout the entire world, with a new manufacturing plant just being opened by his son Ashok in Bangalore, India.

Mr. Chadda was a very well respected CEO and president of **POWERSEM** and business leader not only in the German industrial and political landscape, but, internationally recognized, especially, in India, where he engaged in numerous projects and strategic alliances with large Indian companies. He was a philanthropist, always believing in giving back to his community and country by constantly funding charitable projects.

Mr. Madan Mohan Chadda was truly a devoted husband and father, whose relentless energy and passion for power electronics helped him realize his dreams in building up his company.

Mr. Chadda left us in 2002. He is survived by his wife, Mrs. Suman Chadda, his son Ashok Chadda and his daughter Kavita Soni.

POWERSEM GmbH is now managed and led in the spirit of **Mr. Chadda** by his son Ashok.

In 2005 **POWERSEM GmbH**, Germany, has formed its 100% EOU-Unit* „**POWERSEM Semiconductors Pvt. Ltd.**" in Bangalore, India.
In spirit of **Madan Mohan Chadda**, who always was a proud Indian, **POWERSEM Germany** and **POWERSEM India** wishes to serve its Indian customers with newest innovations and latest technologies. **POWERSEM** hopes to be an essential help for the industrial and economical growth of the Indian Semiconductor/Power Modules Manufacturing Market.

POWERSEM Power-Pac™

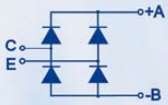
Multiple Chip Technology (MCT)

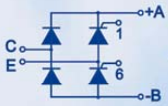
Rectifier Bridges, AC Controller and Power Modules
single, three phase, half & full controlled

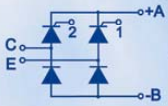
Features:
Package with fast on terminals - Isolation voltage 3000 V ~
Current ratings 30-70 A - Blocking voltage up to 1800 V
Low forward voltage drop - Offers wide choice of circuit configuration and integration of Diodes, Thyristors and FREDs
Planar glasspassivated chips and DCB Technology

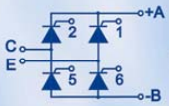
Applications:
Supplies for DC power equipment - Input rectifiers for PWM inverter - Battery DC power supplies - Softstart capacitor charging - Field supply for DC motors

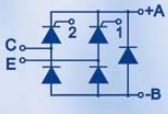
Advantages:
Easy to mount with two screws
Space and weight savings - Improved temperature and power cycling

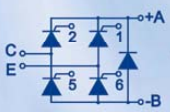


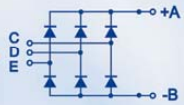


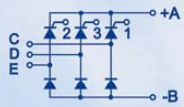


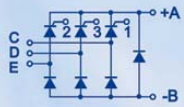


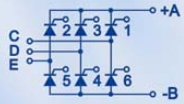


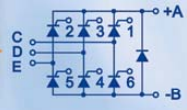


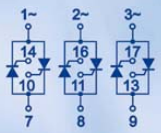












your power bridge to the connection future

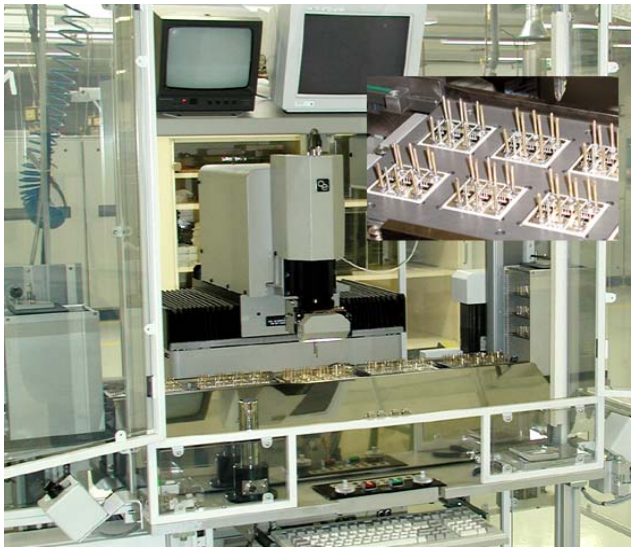
COMPANY PROFILE

POWERSEM GmbH, founded in Schwabach, Germany, in 1985 is a company devoted 100% to the design, development and automated production of **multiple chip semiconductor** modules. Today, **POWERSEM** is considered a world leader in supplying isolated base packaged modules for **standard, fast single**, **three phase**, **half and full controlled** power semiconductor modules including **solid state relays**.
POWERSEM GmbH has also successfully developed strategic alliances with high tech silicon foundries, showing a total commitment to serve its customers, now and in the future.

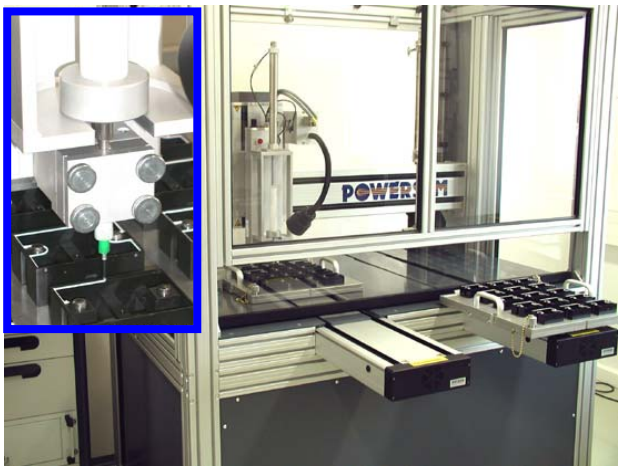
These small but thermal efficient mini circuit modules provide the 'SINGLE PACKAGE' concept, which can be used as single devices in series or parallel replacing SOT-227, TO-247 discretes as well as older standard dual multiple chip modules traditionally supplied by various competitors. Currents from 8 – 230 Amperes and voltages up to 1800 Volts are standard.

Recently, **POWERSEM**, building "Power Bridges to the Future", has introduced IGBT and MOSFET dices into its modules along with corresponding rectifiers. Further, to enhance performance, **POWERSEM** is offering these multiple integrated chips in the unique **POWERSEM** exclusively designed ECO-PAC module packages. ECO-PAC modules offer low profile, compact design and complete economical system solutions. These ECO-PAC modules include separate or embedded drive circuits for motor control/soft start, UPS power supplies, power factor correction, and other applications and are specifically dominant in automotive applications. Incorporating "application specific power circuits", these high quality ECO-PAC modules offer simple solutions for customer design with minimum electrical connections and **printed circuit board** with screw tops for high power applications.



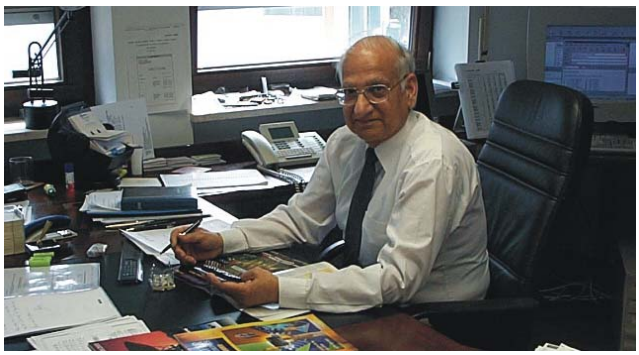
POWERSEM continues to innovate new modular power semiconductor solutions for the demanding requirements of the electronic industry and provides excellent quality and reliability. The basis for this **High-Tech** integrations, using **Multiple Chip Technology (MCT)** and a single package module, provides the customer with a complete solution. In order to achieve these goals, a continuous investment in automated production and quality control is being constantly made.

Due to an increasing power demanding world, manufacturers of many products are seeking higher power integrated multiple chip modules. Powersem is prepared to offer these 'value - added' products for markets ranging from **switch-mode power supplies**, **automation**, **motor drives**, **medical applications**, etc., including **hybrid/electric vehicles**.



100 % optical and electrical testing of the modules is installed to maintain the highest quality and reliability of all our products. All modules are **UL** certified and all processes are optimized according to **DIN ISO 9001: 2000**.

Continuing the business in the spirit of **Madan M. Chadda** - the founder of **POWERSEM GmbH** – his son **Ashok Chadda** and his highly qualified staff guarantee long term innovations and highest quality of power semiconductor modules.



Madan M. Chadda,
founder of **POWERSEM GmbH**

new --- new --- new --- new

Enlarging its Product Range **POWERSEM** offers its customers two **new** packages:

ECO-PAC™ 3 a **new** member of the ECO-PAC™ family

and

ECO-TOP™ 1 a **new** economical package

R_{thJS}	Thermal resistance junction to heatsink
R_{thCH}	Thermal resistance case to heatsink
R_{thJA}	Thermal resistance junction to ambient
R_{thJC}	Thermal resistance junction to case
R_{thJH}	Thermal resistance junction to heatsink
T_A	Ambient temperature or temperature of the cooling medium
T_C	Case temperature
T_J, T_{VJ}	Junction temperature
T_O	Operating temperature
T_{VJM}	Maximum junction temperature
$t_{d(off)}$	Turn-off delay time
$t_{d(on)}$	Turn-on delay time
t_f	Current fall time
t_q	Turn-off time
t_r	Current rise time
t_{rr}	Reverse recovery time
V_{CES}	Collector-emitter voltage (IGBT)
$V_{CE(sat)}$	Collector-emitter saturation voltage with I_B and I_C specified
V_{DRM}	Maximum repetitive off-state voltage
V_{DSS}	Drain source breakdown voltage
V_{FM}	Forward voltage drop
V_{vRMS}	Maximum allowed AC-voltage (RMS-value)
V_{RRM}	Maximum repetitive reverse voltage
V_{TM}	Zero turn-on voltage
V_{TO}	Threshold voltage (for power loss calculations only)

Symbols and Terms

DCB

DCB means **Direct Copper Bonding** and denotes a process in which copper and a ceramic material are directly bonded.

Properties of DCB ceramic substrates

- Good mechanical strength; mechanically stable shape, good adhesion and corrosion resistant
- excellent electrical isolation
- very good thermal conductivity
- superb thermal cycling stability
- the thermal expansion coefficient is close to that of silicon, so no interface layers are required
- good heat spreading
- may be structured just like printed circuit boards or „IMS substrates“
- environmentally clean

Advantages to the user

- The 0.3mm thick copper layer permits higher current loading for the same conductor width. Assuming the same copper cross-section the conductor needs to be only 12% of that of a normal printed circuit board.
- The excellent thermal conductivity provides the possibility of very close packaging of the chips. This translates into more power unit of volume and improved reliability of systems and equipment.
- The high insulation voltage results in improved personnel safety.
- DCB ceramic is the basic for the „chip-on-board“ technology which represents the packaging trend for the future.

Diodes for High Switching Frequencies

Fast Recovery Epitaxial Diodes (FRED)

Power switches (IGBT, MOSFET, BJT, GTO) for applications in electronics are only as good as their associated freewheeling diodes. At increasing switching frequencies, the proper functioning and efficiency of the power switch, aside from conduction losses, is determined by the turn-off behavior of the diode (characterized by Q_{rr}, I_{RM} and t_{rr} see fig.2). With optimized ultra-fast switching diodes, the development engineer has various possibilities: either higher pulse rate or higher current load or smaller heatsink or more conservative operation due to „cooler" chips.

The reverse current characteristic following the peak reverse current I_{RM} is another very important property. The slope of the decaying reverse current di_{rr}/dt results from design parameters (technology and diffusion of the diode chips). In a circuit this current slope, in conjunction with parasitic inductances (e.g. connecting leads), causes overvoltage spikes and high frequency interference voltages. The higher the di_{rr}/dt („hard recovery" or „snap-off" behavior) the higher is the resulting additional stress for both the diode and the parallel switch. A slow decay of the reverse current („soft recovery" behavior) is the most desirable characteristic, and this is designed into all diodes. The wide range of available blocking voltages makes it possible to apply these diodes as output rectifiers in switch-mode power supplies (SMPS) as well as protective and free-wheeling diodes for power switches in inverters.

Diodes for General Purpose Applications

Standard Recovery Diodes

Diodes are mainly used for rectifying 50 or 60 Hz main current and are available in different bridges for standard line voltages (from 110 to 600V).

Avalanche Diodes

Avalanche diodes or surge-voltage proof rectifier diodes differ from standard diodes in the following manner: the operation in avalanche breakdown above the normal reverse blocking voltage (V_{RRM}) can be tolerated as long as the power is within the specified permissible nonrepetitive reverse surge dissipation P_{RSM} at the specified pulse width. In order to have technologically good control of the avalanche breakdown, it is important to ensure homogeneous doping of the middle zone of the silicon chip and suitable junction termination and passivation at the edges where PN-junctions are exposed to the surface (high field strength at the edge). Because of this ruggedness against periodically occurring shortterm voltage surges in the blocking direction, the user frequently can do without protective overvoltage networks. In addition, if avalanche diodes are put in series for high voltage applications, the sharp avalanche breakdown of the blocking characteristic ensures static and dynamic voltage distribution uniformly across each device. Thus, in general, none of the series diodes will be overstressed by reverse voltages which are substantially above the avalanche voltage.

New Generation Silicon Chips

The figures 1a-c show the cross sections of the used thyristor and diode chips in the passivation area. All chips are designed by applying separation diffusion processes such that the zones responsible for the surface field strength are located at the upper chip side. This results in the capability of soldering the entire chip area onto the DCB ceramic substrate without a molybdenum strain buffer, which in turn leads to good stability of the chips as well to large area heat dissipation if a load is applied. All zones at the edges which are decisive for the blocking stability are coated with passivation glasses the coefficient of expansion of which match that of silicon. Silicon chips increasingly use planar technology with guard rings and channel stoppers to reduce electrical surface fields. This chip design supersedes the design of thyristor chips which were fabricated with passivation moats so that modules of the new series designed with the updated state-of-the-art utilize planar glasspassivated chips processed by separation diffusion techniques. The contact areas of the chips possess physical vapour deposited metal layers. For the user the improved properties are:

- Excellent long-term stability of blocking currents and blocking voltages,
- increased life time of the internal soldered connections,
- high power cycling capability (≥ 50.000).

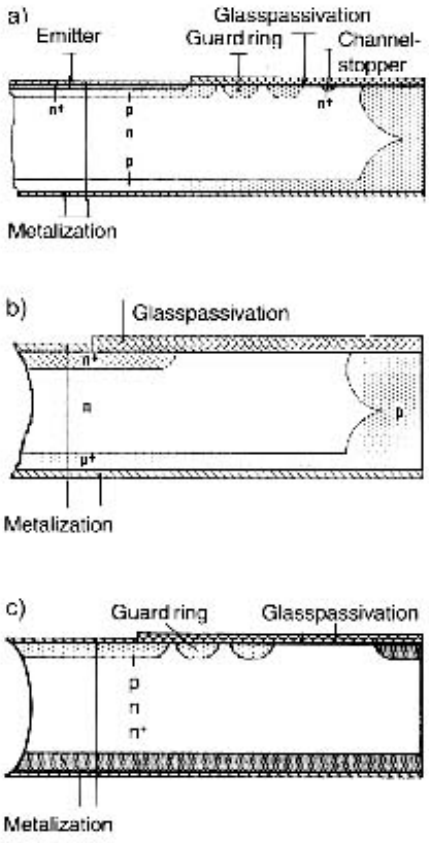

Fig. 1a-c: Cross section of thyristor and diode chips in the passivated area

a) glasspassivated planar thyristor chip with separation diffusion, type CWP

b) glasspassivated planar diode chip with separation diffusion, type DWN

c) glasspassivated planar diode chip type DWP (reverse polarity to b)

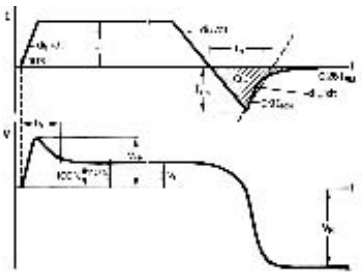

Fig.2: Current and voltage during turn-on and turn-off switching of fast diodes.

Trench Gate IGBT

IGBT switches based on DMOS structures are now reaching the point of diminishing returns insofar as performance is concerned.
Only minor improvements in key parameters, such as switching and conduction losses, can now be expected. For gains that are more dramatic, semiconductor device designers look towards more advanced structures.
The most promising of these new structures is the **trench-gate**.
Figure3 compares the standard DMOS and the new Trench-gate IGBT structure. Trench-gate structure derives its name from the trench shape **(see Figure 4)** etched into the surface of the silicon wafer. This trench houses the gate rather than placement of the gate on the surface as in the DMOS structure.
This allows a shrink in feature size and minimising the parasitic JFET effect dominant in the DMOS.
The trench gate IGBT can deliver major improvements in the on-state characteristics while maintaining a short circuit withstand capability comparable to that of the best planar IGBT structures. The trench structure allows greater flexibility in the engineering of the conductivity modulation, resulting in an improved trade-off between on state and switching losses. Table 1 shows the improvements in key parameters when compared with similarly rated 1200V 25A conventional IGBTs.

TABLE 1 : Key Parameters

Parameter	Trench Gate	DMOS
V_{CES} (V)	1200	1200
I_C dc (A)	25	25
$V_{CE(sat)}$ (V)	1.9	2.8
t_{ON} (ns)	175	125
t_{OFF} ((ns)	310	250
C_{ies} (pF)	4000	4385
E_{ON} (mJ)	1.5	2.2
E_{OFF} (mJ)	2.5	2.5

Figure 3: Comparison between standard DMOS and trench-gate IGBT structures (below)

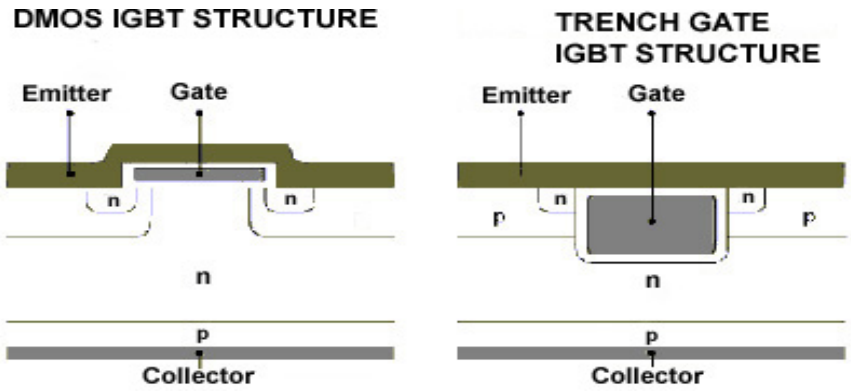

Figure 4: Trench shape etched into the surface of the silicon wafer (below)

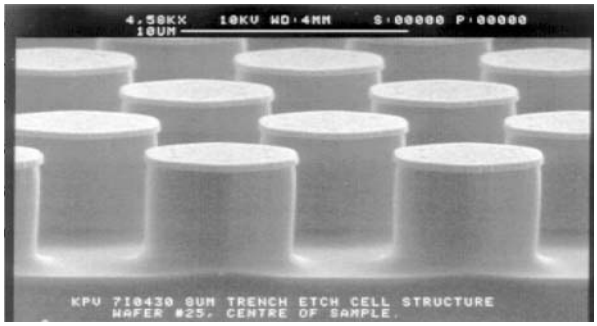

ECO-PAC™ a Package Concept Developed by POWERSEM for Custom Designed Power Modules

Accomplishing and enlarging its product range **POWERSEM** has introduced IGBT and MOSFET dice into its power modules along with corresponding rectifiers. Further, to enhance performance, **POWERSEM** is offering these multiple integrated chips in the unique **POWERSEM** exclusively designed ECO-PAC™ 1 and ECO-PAC™ 2 module packages. ECO-PAC™ modules offer low profile, compact design and complete economical system solutions. Using a standard height of 9 mm, all circuit configurations in ECO-PAC™ 1 as well as in ECO-PAC™ 2 can be combined on the same printed circuit board as depicted in Fig. 1.

These small but thermal efficient mini circuit modules can be used as single devices in series or parallel replacing SOT-227, TO-247 discretes as well as older standard dual multiple chip modules traditionally supplied by various competitors. Currents from 6 – 230 Amperes and Voltages up to 1800 Volts are standard. More than 80 different circuit configurations either in ECO-PAC™ 1 or in ECO-PAC™ 2 offer **POWERSEM**'s customers a comprehensive choice of devices. Besides, the ECO-PAC™ package (1 and 2) is especially suited to realize customized solutions within a short time.

The ECO-PAC™ module is directly soldered by gold plated copper terminals on the pcb (printed circuit board). As the terminal positions are not fixed, the current leading connections from the ceramic substrate to the printed circuit board can be designed extremely short, hence reducing inductivities. On the other hand, the free choice of the pin configuration permits an optimal and effective exploitation of the substrate area.

Due to the small dimensions, ECO-PAC™ 1 and ECO-PAC™ 2 (see Fig. 2) offers a weight and space saving solution, reducing the consumption of materials and thus lowering the production costs and the price. Finally, a small package means a reduction of the demanded space for the power modules and consequently a decrease of the complete device dimensions.

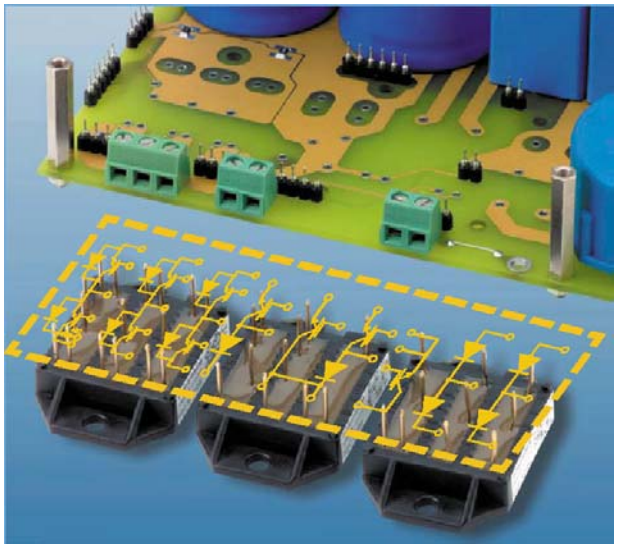

Fig. 1: Combination of different ECO-PAC™ modules on the same pcb.

Two insulating compounds, a soft one covering the dice with a 3mm thick layer and permitting a reduction of mechanical stresses caused by thermal tensions of the module and a hard epoxy encapsulating the module against all environal influences (e.g. humidity), are the prerequisites of the high quality of ECO-PAC™ 1 and ECO-PAC™ 2.

All products in ECO-PAC™ 1 and ECO-PAC™ 2 have got connection leads with expansion bends for stress relief (see Fig. 3).

The usage of dcb (direct copper bonded ceramic substrates) allows an optimum heat transfer and leads together with the used planar glass passivated chips to excellent long term reliability and thermal/load cycling capability.

Technical Explanations

Typical applications of ECO-PAC™ 1 and ECO-PAC™ 2 modules are: **supplies for DC power equipment, battery DC power supplies, AC/DC motor drives, motor control/soft start, UPS, pumps and fans, household appliances, air conditioning, frequency inverters, welding inverters, power factor correction, AC servo and robot drives**.

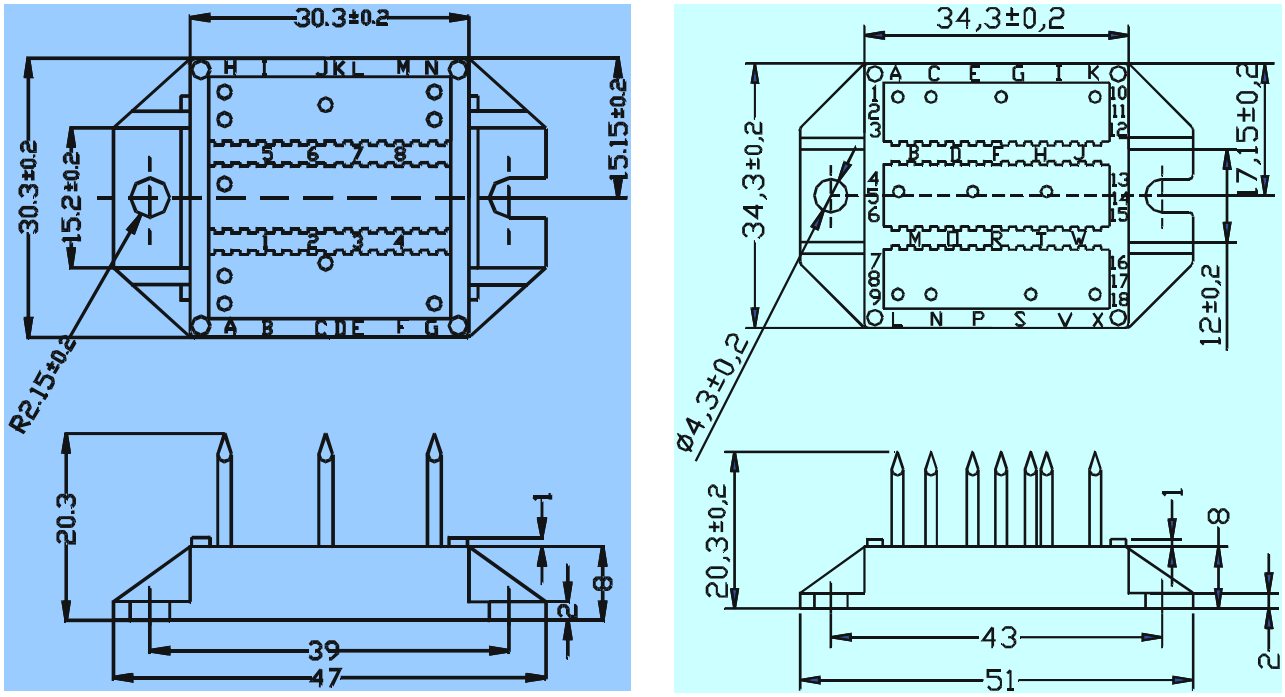

Fig. 2: outline drawings of ECO-PAC™ 1 (upper left) and ECO-PAC™ 2 (upper right). All dimensions are given in mm.

Fig. 3: Gold plated copper terminals with expansion bend

ECO-PAC™ 2

Lowest Profile Package
Highest Performance
Multifunctional

E C O - P A C ™ 2 from **POWERSEM** offers a wide choice of circuit configurations and integrations of diode, thyristor, MOSFET and IGBT chips within a single package, thereby reducing the number of external connections.
It provides isolation voltages **of over 3600 Vac RMS**, allows optimum heat transfer direct to the heat sink and is suitable for soldering on printed circuit boards. The usage of DCB technology and planar glasspassivated silicon diffused chips in ECO-PACs™ leads to excellent long term reliability and thermal/load cycling capability. A single packaging concept of **ECO-PAC™ 2** has been designed as an electrical replacement for 6-230 Amp Thyristor/ Diode modules, Isotops, SOT-227 and TO247, traditionally supplied by IR, EUPEC, Silicon Power Cube and other manufacturers. However, its low profile packaging enables compact design and economic system solutions.
Main applications for **ECO-PAC™ 2** are as supplies for **DC power equipment, AC/DC motor drives, soft start capacitor charging, UPS** and **Power Factor Correction**.

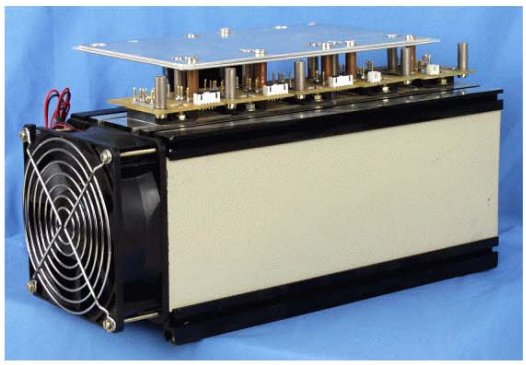
ECO-BLOCK™
B2CI-230/230-20F

GENERAL DESCRIPTION



The ECO-BLOCK™ consists of a Rectifier, Buck/Boost Converter and H-Bridge Inverter all mounted on a single force-cooled heatsink. The use of Powersem ECO-PAC™ modules for the Rectifier, Buck/Boost and Inverter stages offers a **weight** and **space saving** solution and an **improved power/weight ratio at a lower cost**. The DCB (Direct Copper Bonded) base of the Powersem ECO-PAC™ modules allows **optimum heat transfer** and makes the ECO-BLOCK™ highly efficient due to low thermal impedance, **reducing the heat sink size**.

FEATURES

- Input parameters – 230 V / Single phase
- Output parameters – 230 V / 20A / Single phase
- Battery charger – 110V / 20A / Buck converter
- DC Link voltage – 400 V / Boost converter
- Crest factor – 1:2
- Improved power/weight ratio
- Low-Inductance sandwiched bus-bar arrangement for DC Link

APPLICATIONS

- UPS systems and Inverters
- AC Drives
- Power electronic Converters

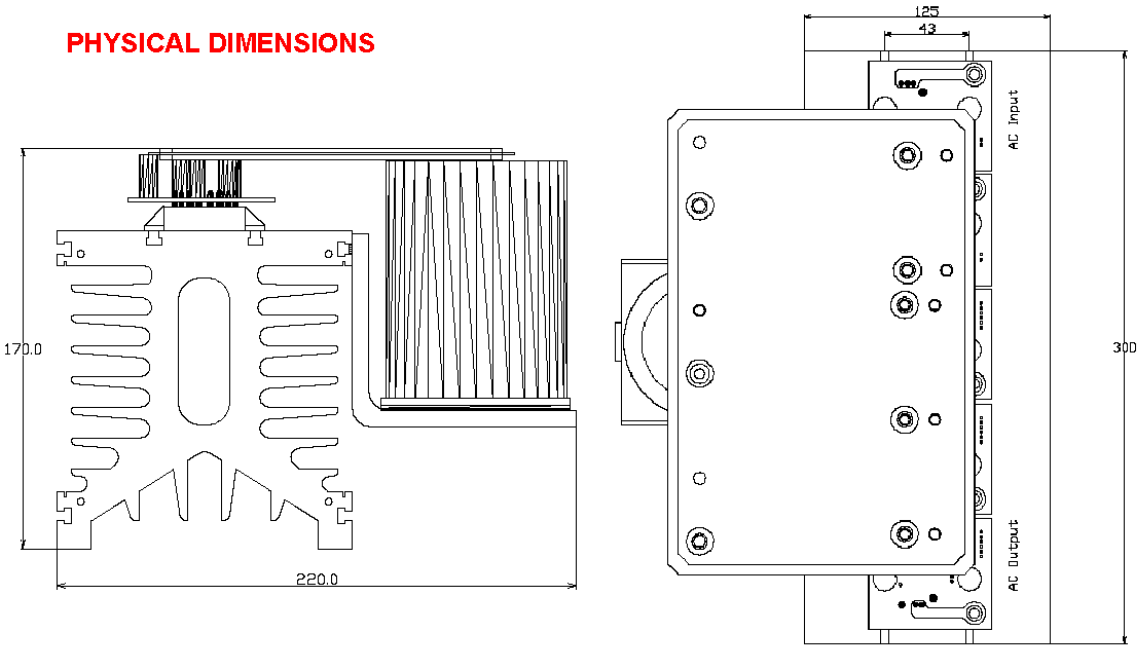
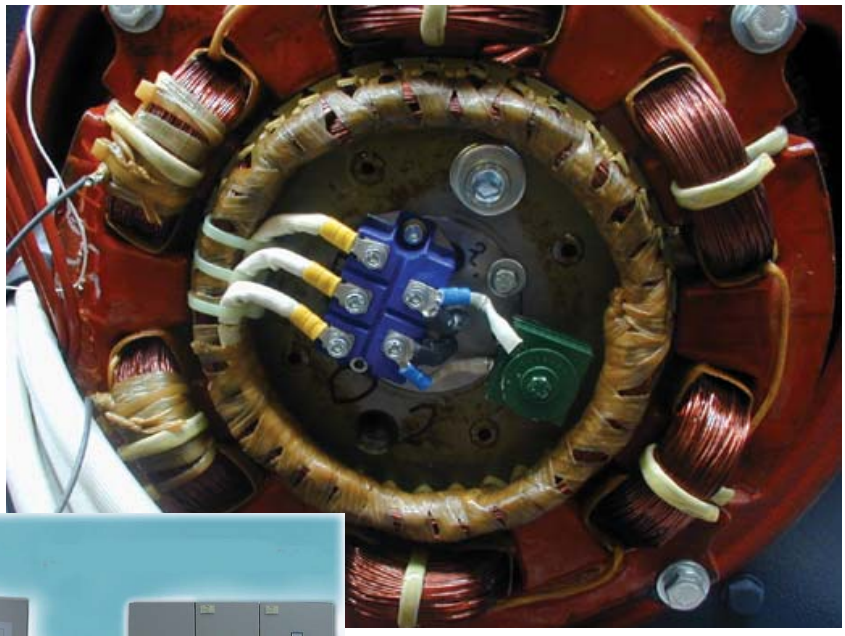
V_{dc}	Charger Voltage	Typical	110	V (dc)

PHYSICAL DIMENSIONS

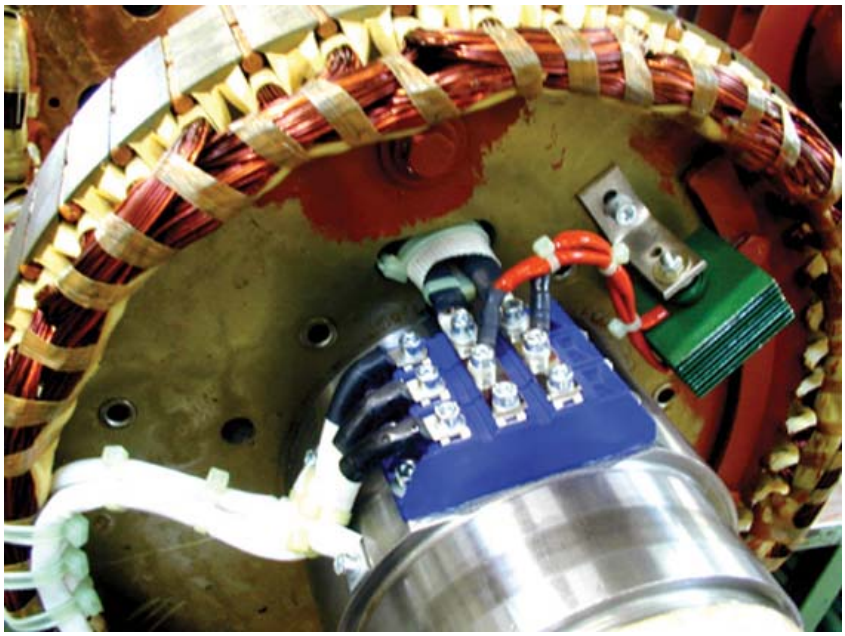


TRACTION-PAC™ - YOUR solution for high – speed – rotating systems:

Three phase rectifier bridge **PSTD 82** mounted on the high speed rotating shaft of an UPS System



APPLICATION:
Uninterrupted Power Supply (UPS) Systems



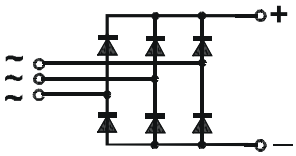
Three phase leg diode modules **PSTKD 82** mounted on the high speed rotating shaft of an UPS System

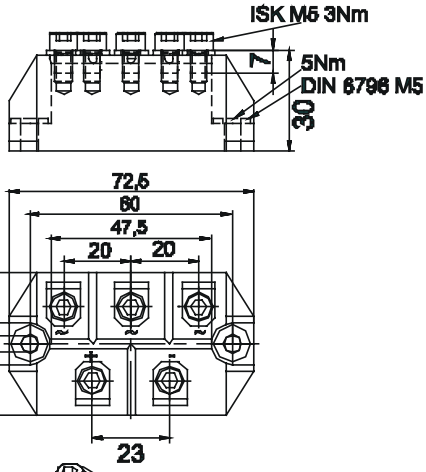
TRACTION-PAC™ - YOUR solution for high – speed – rotating systems:

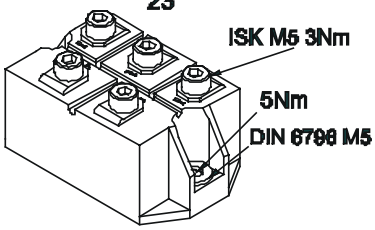
Three Phase Rectifier Bridge PSTD 82

PSTD 82

V_{RRM}: 600 - 1800 V
I_{DAV}: 88 A @ T_C = 110 °C
I_{FSM}: 750 A (10 ms, 45 °C)
V_{T0}: 0.8 V
r_T: 5 mΩ
T_{VJM}: 150 °C
R_{thJC}: 1.10 K/W
R_{thJH}: 1.52 K/W



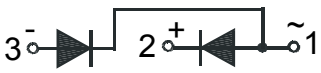


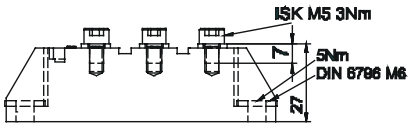


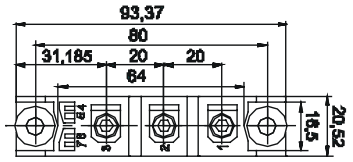
Diode Module PSTKD 82*

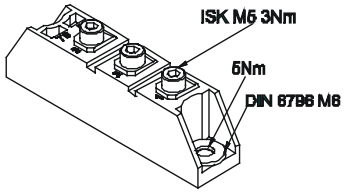
PSTKD 82

V_{RRM}: 600 - 1800 V
I_{DAV}: 80 A @ T_C = 110 °C
I_{FSM}: 1700 A (10 ms, 45 °C)
V_{T0}: 0.8 V
r_T: 2.7 mΩ
T_{VJM}: 150 °C
R_{thJC}: 0.35 K/W
R_{thJH}: 0.55 K/W









***also available as thyristor module**

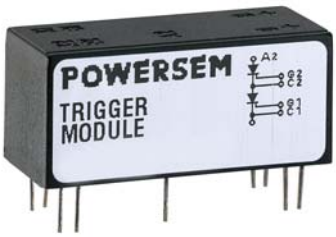
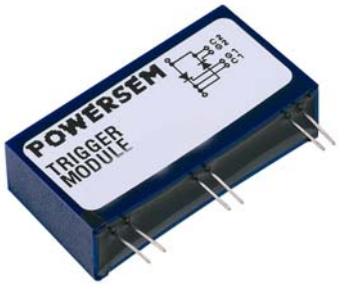
Active Trigger Units for Thyristors

- DIRECT CONNECTION TO THE OUTPUTS OF MICRO-CONTROLLERS, MICROPROCESSORS, CPLD`S AND FPGA`S IS POSSIBLE
- NO ADDITIONAL COMPONENTS NEEDED
- SMALL SIZE
- LONG GATE LEADS ARE POSSIBLE
- SIMILAR COSTS WITH CONVENTIONAL TRIGGER CIRCUITS DUE TO SAVING IN BOARD SPACE, SIZE IN POWER SUPPLY, SIZE IN SNUBBER NETWORK, OTHER COMPONENTS, LABOR AND INVENTORY
- PROVEN RELIABILITY IN VERY HARSH ENVIRONMENT OVER MANY YEARS





ELECTRICAL SPECIFICATIONS

Peak thyristor voltage	> 2000V (1200V or 2200V upon request)
Gate trigger current	> 1.2A with 2A/µs at 400V anode voltage typical
Control current	< 12 mA into optocoupler
Turn on delay	< 20 µs at 12 mA control current
Input-output insulation	> 800V peak continuous- 6KV 10s - according to VDE 0884
Temperature range	-25°C-+85°C

Types			**Dimensions (mm)** (top view)
V_{DRM}	2000Vpk	1200Vpk	
Phase control for two thyristors with two inputs (all applications) **Weight = 24 g**	PSTT PC/20	PSTT PC/12 upon request	 Height 19 mm pcb hole size 0.8 mm
Single control input for two thyristors (AC Controller) **Weight = 20 g**	PSTT SC/20	PSTT SC/12 upon request	 Height 23 mm pcb hole size 0.8 mm
Zero crossing for two thyristors **Weight = 20 g**	PSTT ZC/20	PSTT ZC/12 upon request	 Height 23 mm pcb hole size 0.8 mm

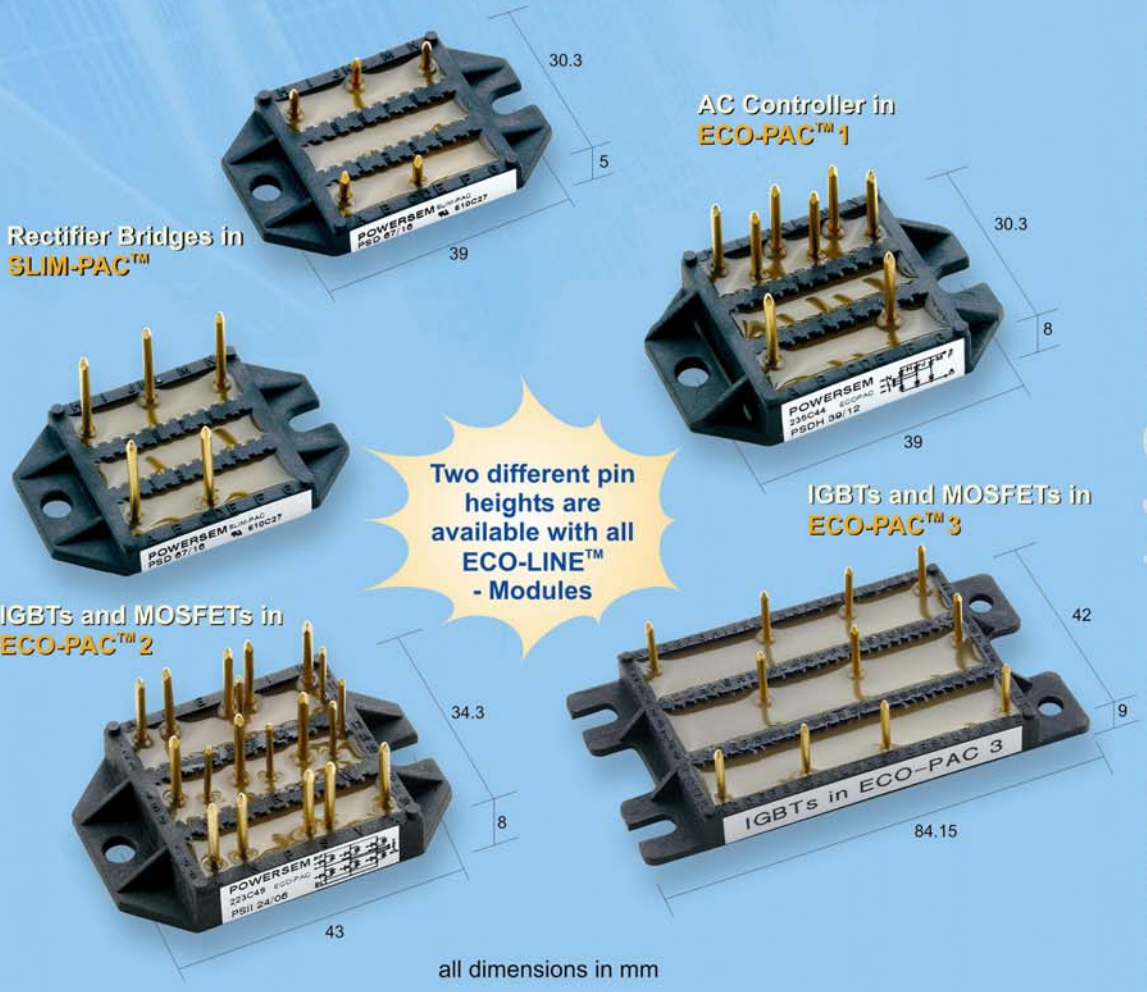
POWERSEM

Lowest Profile Package for Power Modules with Highest Performance and Widest Choice of Customized Circuit Configurations



- Customized choice of Circuit Configurations
- High - Tech Integrations of Diode, Thyristor, IGBT and MOSFET Chips
- One Package Concept for Current Ranges from 29A - 200 A and Blocking Voltages from 600 - 1800 V

ECO-PAC™ 2

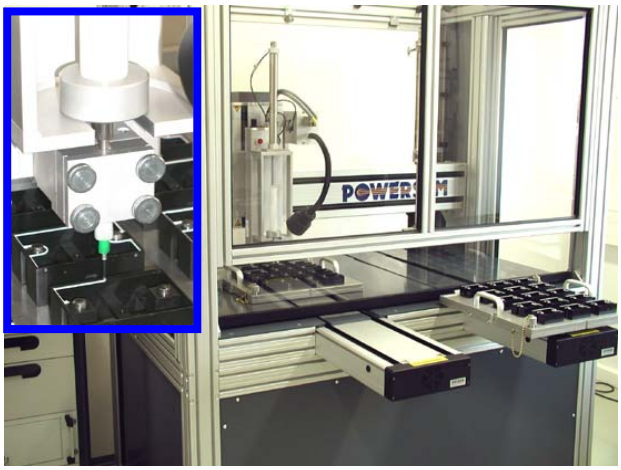
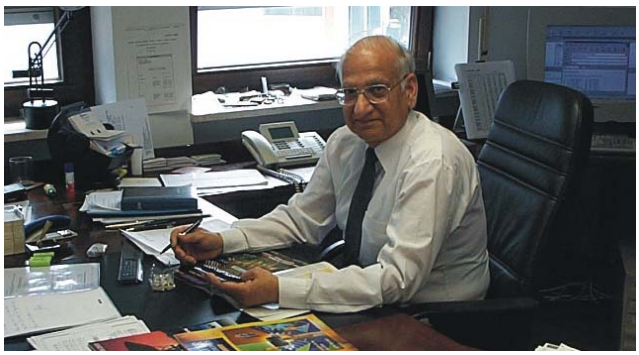
Due to an increasing power demanding world, manufacturers of many products are seeking higher power integrated multiple chip modules. Powersem is prepared to offer these 'value - added' products for markets ranging from **switch-mode power supplies**, **automation**, **motor drives**, **medical applications**, etc., including **hybrid/electric vehicles**.



100 % optical and electrical testing of the modules is installed to maintain the highest quality and reliability of all our products. All modules are **UL** certified and all processes are optimized according to **DIN ISO 9001: 2000**.

Continuing the business in the spirit of **Madan M. Chadda** - the founder of **POWERSEM GmbH** – his son **Ashok Chadda** and his highly qualified staff guarantee long term innovations and highest quality of power semiconductor modules.



Madan M. Chadda,
founder of **POWERSEM GmbH**

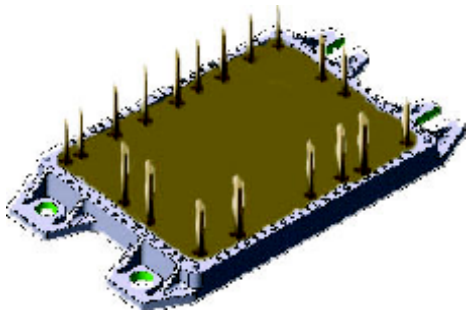
new --- new --- new --- new

Enlarging its Product Range **POWERSEM** offers its customers two **new** packages:

ECO-PAC™ 3 a **new** member of the ECO-PAC™ family

and

ECO-TOP™ 1 a **new** economical package



new --- new --- new --- new

POWERSEM GmbH confirms that all products manufactured by **POWERSEM** are compliant to the

DIRICTIVE 2002 / 95 /EC OF THE EUROPEAN PARLIAMENT AND OF THE COUNCIL

of 27 January 2003
on the **r**estriction **o**f the use of certain **h**azardous **s**ubstances in electrical and electric equipment (**RoHS**).

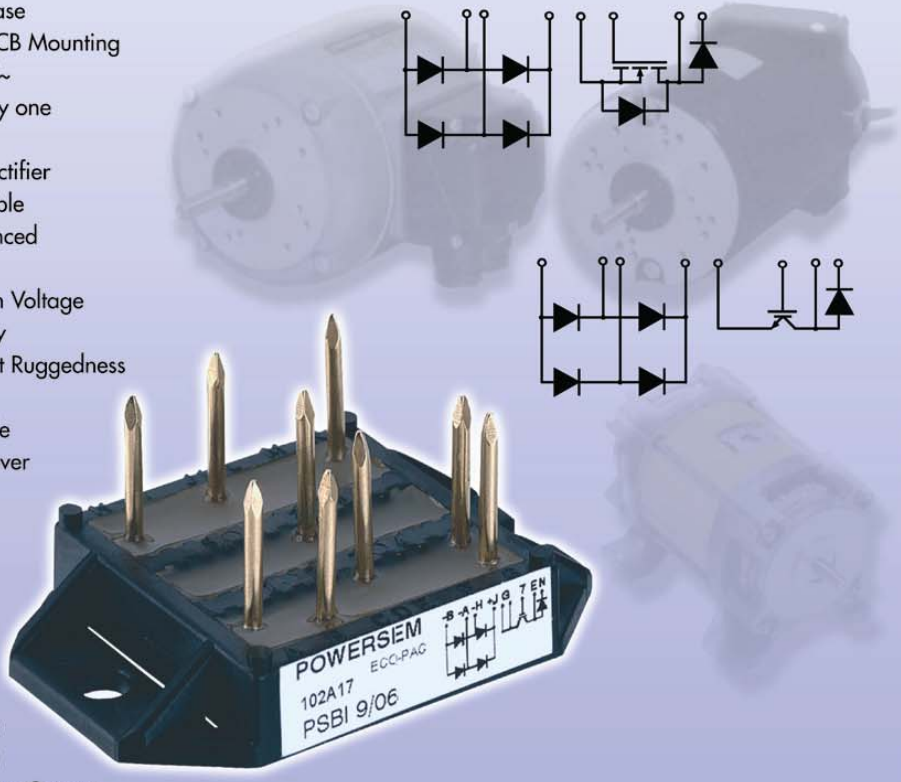
POWERSEM ECO-PACs™

Power Factor Correction Module in ECO-PAC™

Features

- Package with DCB Ceramic Base Plate and Soldering Pins for PCB Mounting
- Isolation Voltage over 3000 V~
- High Level of Integration – only one Power Semiconductor Module required for the whole PFC Rectifier
- Standard PFC Control ICs usable
- Fast Rectifier Diodes for Enhanced EMC behaviour
- NPT IGBT with Low Saturation Voltage
- Ultra Fast Switching Capability
- High RBSOA and Short Circuit Ruggedness
- Internally Series Connected
- HiPerFRED Freewheeling Diode for Fast and Soft Reverse Recover at High Switching Frequency



Applications

- Single Phase Rectification with Power Factor Correction (PFC)
- Low Harmonic Content of Mains Current
- Mains Current and Voltage in Phase
- Wide Input Voltage Range, controlled Output Voltage

your power bridge to the connection future

SOLID STATE RELAYS

with

DIRECT COPPER BONDED TECHNOLOGY
PLANAR GLASS PASSIVATED CHIPS

Current Ratings: 40 - 205 AMPS
Blocking Voltage: upto 1800 Volts

registered, E197669

Weight = 146 g

The SSR output is a back to back SCR configuration (two SCRs are connected antiparallel). These are direct copper bonded planar glass passivated thyristor chips. The DCBs offer very unique advantages like:

- **Much higher load cycle resistance due to very strong mechanical interconnection between copper and ceramic**
- **Lower thermal coefficient of expansion**
- **Ideal heat spreading without any hot spots**
- **Higher fusing current**
- **The life-time of the SSR is 10 to power of 9 load switchings compared to the 10 to the power of 6 mechanical switchings for an electromechanical relay**
- **The SSR features an isolation of 4000 volts (I/P and O/P) and 1500 volts between chassis and the terminals**
- **The I/P control is compatible to TTL logic (AC I/P control also available for control panel application)**
- **The I/P control is protected against reverse polarity**
- **Available in single and three phase versions**
- **Same casing right from 10-175 Amps and conformed to ``UL `` standards**
- **Safety cover available to protect against live terminals**
- **LED is standard**

Main applications for SSRs are M/C Tools, SPMs (SPL. Purpose M/Cs), Process Control Equipments, Traffic Controls, Vending M/Cs, Heating Applications, Textile Industries, Microprocessed Based Systems and Food Industry.

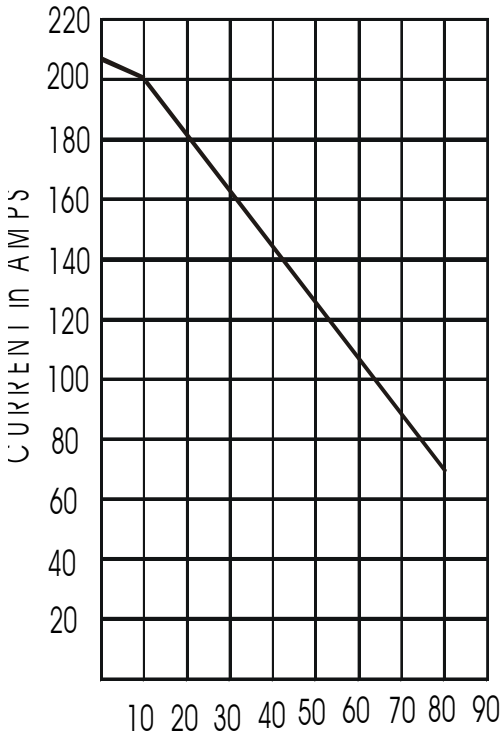
HEAT SINK USED: 0,14 K/W

FAN USED: 70 CFM FOR 125 A

FAN USED: 100 CFM FOR 150 A - 175 A

VALID FOR SERIES: PSB 20 SJK (125 A - 175 A)



HEAT SINK USED: 0,1 K/W

FAN USED: 100 CFM FOR 205 A

Three Phase Solid State Relays

HIGHLIGHTS

Series: 12 SJ/K

- INPUT: DC CONTROL
- HIGH DV/DT
- OUTPUT: DIRECT COPPER BONDED BACK-TO-BACK SCR
- OPTO ISOLATION 2500 VAC (4000 V optional)
- VOLTAGE RANGE 100 TO 660 VAC
- LOAD CURRENT 3x25A / 50A / 75A / 90A
- REVERSE POLARITY PROTECTION FOR DC INPUT CONTROL
- Weight = 344 g

(J: Zero voltage turn-on; K: Random turn-on)

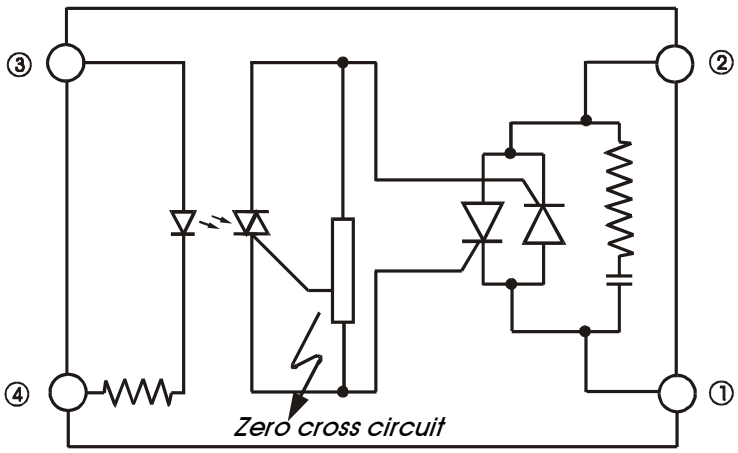
Features of DIN Ready SSR

- AC SOLID STATE CONTRACTOR IN 30 mm HOUSING
- ZERO SWTICHING FOR HEATING AND MOTOR APPLICATIONS/RANDOM SWITICHING
- RATED OPERATIONAL CURRENT 10 A, 16 A & 25 A (40 A WITH FORCED COOLING
- RATED OPERATIONAL VOLTAGE 120/230 VAC, 400/480/660
- TRANSIENT OVER VOLTAGE PROTECTION (OPTICAL)
  LED INDICATOR SHOWING RELAY ''ON'' STATUS
- IP 20 PROTECTION
- DIN – RAIL AND BACK PLATE MPONTABLE
- CONNECTING TERMINALS LAYOUT AS CONTRACTOR OR SSR STANDARD
- OPTO-ISOLATION > 400 V
- BUILT IN SNUBBER



1 Output 3 Input (+)
2 Output 4 Input (-)

Single Phase Solid State Relays

HIGHLIGHTS

Series: 1 SJ/K

- INPUT: AC CONTROL
- OUTPUT: BACK-TO-BACK SCR
- OPTO ISOLATION 2500 VAC (4000 V optional)
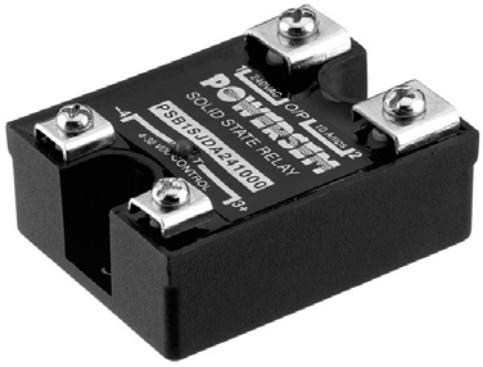
- ZERO VOLTAGE TURN-ON/ RANDOM TURN-ON
- SAFETY COVER (optional)
- BUILT IN SNUBBER
- CHASSIS MOUNTABLE
- LED INDICATOR SHOWING RELAY 'ON' STATUS
- Weight = 106 g

(J: Zero voltage turn-on; K: Random turn-on)



10 – 40 A

Operating temperature	T_O	-30 to +80	-30 to +80	-30 to +80	-30 to +80	°C
Turn-on time	T-on	40	40	40	40	ms
Turn-off time	T-off	80	80	80	80	ms
Fusing current	I^2t	72	128	3700	5000	A^2s

ALL ELECTRICAL PARAMETERS MEASURED @ T_A= 25 DEG C

released, E 197669

DIN Ready Solid State Relay

HIGHLIGHTS

- INPUT: DC CONTROL (TTL or CMOS COMPATIBLE)
- OUTPUT: BACK-TO-BACK SCR
- OPTO ISOLATION 2500 VAC (4000 V optional)
- ZERO VOLTAGE TURN-ON or RANDOM TURN-ON
- BUILT IN SAFETY COVER
- REVERSE VOLTAGE PROTECTION FOR DC/AC RELAYS
- BUILT IN SNUBBER FOR HIGH DV/DT
- DIN MOUNT OR BACK PLATE MOUNTING
- LED INDICATOR SHOWING RELAY 'ON' STATUS

(J: Zero voltage turn-on; K: Random turn-on)

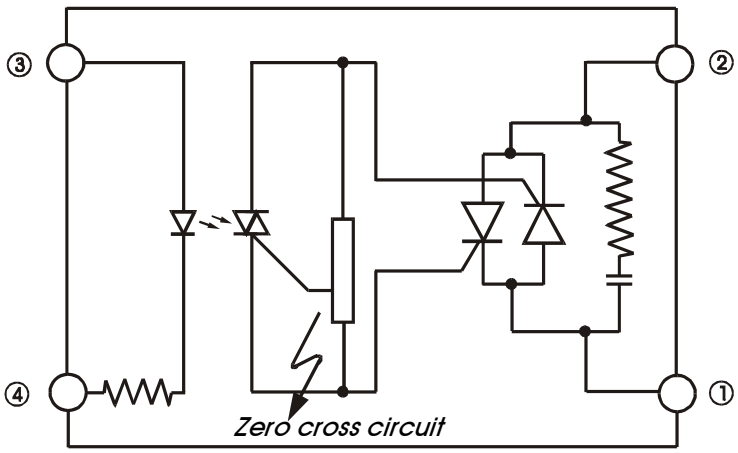
Features of DIN Ready SSR

- AC SOLID STATE CONTRACTOR IN 30 mm HOUSING
- ZERO SWTICHING FOR HEATING AND MOTOR APPLICATIONS/RANDOM SWITICHING
- RATED OPERATIONAL CURRENT 10 A, 16 A & 25 A (40 A WITH FORCED COOLING
- RATED OPERATIONAL VOLTAGE 120/230 VAC, 400/480/660
- TRANSIENT OVER VOLTAGE PROTECTION (OPTICAL)
  LED INDICATOR SHOWING RELAY ''ON'' STATUS
- IP 20 PROTECTION
- DIN – RAIL AND BACK PLATE MPONTABLE
- CONNECTING TERMINALS LAYOUT AS CONTRACTOR OR SSR STANDARD
- OPTO-ISOLATION > 400 V
- BUILT IN SNUBBER



1 Output 3 Input (+)
2 Output 4 Input (-)

Design Information

For Thyristors, Diodes, Thyristor / Diode Modules and Rectifier Bridges

Surge current

The 60 Hz value of I_{TSM} is 10% higher than the 50 Hz value.
The I_{TSM} value at T_{VJM} is 10 to 15% lower than the 45°C value.

Limiting I^2t

50 Hz: I^2t (A^2s) = I_{TSM} (A) • I_{TSM} (A) • ¼ • 1/50 (s) use rated I_{TSM} value (10ms)
60 Hz: I^2t (A^2s) = I_{TSM} (A) • I_{TSM} (A) • ¼ • 1/60 (s) use 60-Hz-value of I_{TSM}

Forward current

The average current ratings in tables are mostly specified for temperature conditions of: T_A = 45°C, T_C = 85°C or T_C = 100°C
For other temperature conditions, the current ratings can be calculated using the following formulas, applicable up to 400Hz:

$$I_{TAV} = \frac{-V_{TO} + \sqrt{V_{TO}{}^2 + 4k^2 r_T P}}{2k^2 r_T} \text{ where } P = \frac{T_{VJM} - T_C}{R_{thJC}} \text{ or } P = \frac{T_{VJM} - T_A}{R_{thJA}}$$

I_{TAV} (A), P (W), V_{TO}(V), r_T(Ω), T_{VJM} (°C), T_C (°C), T_A (°C), R_{thJC} (K/W), R_{thJA} (K/W)

$k^2 = 1$	for DC-current
$k^2 = [\pi/2]^2$	for sinusoidal half wave current
$k^2 = 3$	for 120° rectangular current
$k^2 = 6$	for 60° rectangular current

The average forward current is limited by the RMS-current value I_{TRMS}: When the calculated value I_{TAV} is higher than I_{TRMS}/k, replace it by $I_{TAV} = I_{TRMS}$/k.

Mounting Instructions

Modules and Rectifier Bridges :

Contact surfaces must be free of dirt and be undamaged. The heat sink contact surface must have a flatness of < 0.03 mm (< 1.2 mil) and a levelling depth of <0.02 mm (< 0.8 mil). Apply a thin layer of heat transfer paste evenly to the module's base plate just sufficient to cover the entire base plate to heat sink. It is recommended to apply DC 340 (Dow Corning) or Berulub FZ 1E3 (Bechem, silicone free), or equivalent by using a sponge/soft rubber roller.
The minimum thickness of grease is best controlled by removing some modules from the heat sink after mounting and to inspect the entire area of the metal base plate. The module bottom surface must have wetted completely with thermal grease.
The minimum required depth of thread in aluminium heatsinks is 12 mm and 10 mm in copper heat sink.
All mounting holes must be free from burrs. First tighten all mounting and terminal screws stepwise. Then use a torque wrench to apply the tightening torques given on the data sheet. Make sure that the screws fit easily into the threads. Otherwise the total tightening torque will be reached without the necessary contact being obtained.
Do not pull or push on the terminals when making the electrical connections. Make sure that no permanent tensile force is exerted on the terminals.

Modules and Rectifier Bridges supplied with solderable leads :

The maximum allowable soldering time is 10 seconds. Do not exert any axial force on the leads. Make sure that the distance between the bending axis and package is > 5 mm, with the bending radius > 2 mm. Avoid repeated bending. The distance between solder leads and package should be > 10 mm.

Important note:

The terminal connection torques given in the data sheets are maximum values, depending on the applied connection.
Using current bars, torques up to 5 Nm can be necessary to achieve a tight and reliable connection.
For open cable lugs, a torque of 2.5 Nm is already sufficient to realize a good electrical connection. Higher terminal connection torques could damage the lug itself as well as the module terminals and the housing.
In every case, one should pay attention, that the clamping parts don´t move, while the terminal screws are fastened. Twisting of the terminals would effect mechanical stresses on the terminals themselves and on the housing. Both could reduce lifetime and reliability fo the module.
For each module you can download detailed datasheets from our website or send us your request to datasheets@powersem.net

if you should need more help and information
concerning mounting instructions

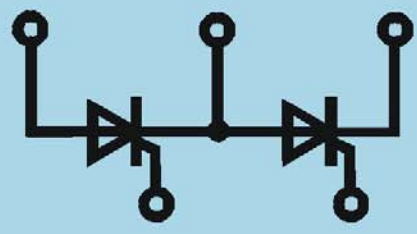
PSKT 96 (ECO-PAC™2)

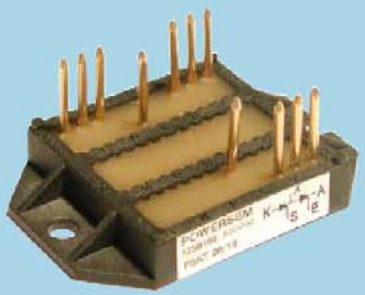


Why using screws?

TO 240

soldering is the solution...

ECO-PAC™



HIGH POWER in small dimensions :

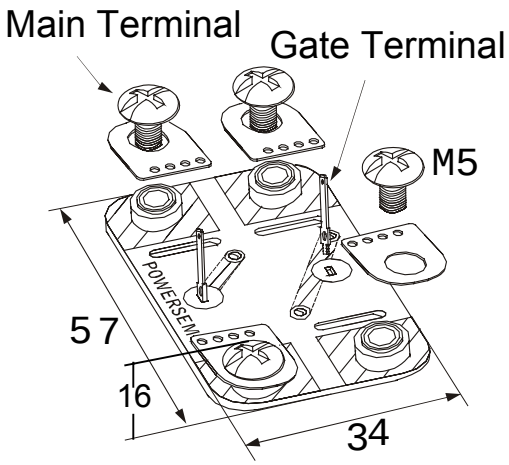
ECO-PAC™ 2

Accessory: ECO-BOARD™

For diode and thyristor modules in ECO-PAC™ 2 a accessory is available:

ECO-BOARD™

This accessory is especially designed for all customers who cannot or do not want to solder the module on a pcb. With this device **POWERSEM** offers its customers to use screws for the terminal connections instead of soldering. The gold plated leads are perfect for soldering the module directly onto the **ECO-BOARD™**.



(dimensions in mm)
